

PREMIUM EXPERIENCE REVIEW

Premium Care ApS — Brand System Audit

Version 1.0 · 8 July 2026 · Controlled document — custody: Creative Director

Mandate: Elevate, not redesign. Every recommendation below answers one question: *Would this make Premium Care feel like Denmark’s most trusted elderly care organisation?* If yes, it is included. If no, it is ignored. Nothing is rebuilt. Nothing is regenerated. Only refinements that materially increase trust and perceived quality.

1. EXECUTIVE SUMMARY

The Premium Care brand system is institutionally sound. The palette is locked. The typography is correct. The heraldic crest is an asset of record. The design system is operational. What follows is not a critique of what is wrong, but a series of surgical elevations — micro-adjustments that compound into a perceptibly more authoritative, warm, and premium experience.

The central insight: Trust in elderly care is not communicated through decoration. It is communicated through *restraint*. Every element that does not actively build confidence should be removed or subdued. The brand currently sits at 80% of its potential. The remaining 20% lives in the negative space, the silence between elements, the precision of alignment, and the hierarchy of information.

Audience priority for this review:

1. Danish municipalities (procurement officers, quality assessors)
2. Families (adult children making decisions for parents)
3. Healthcare professionals (referring nurses, GPs, specialists)
4. Future employees (caregivers, nurses, administrators)

2. THE HERALDIC CREST — PRESERVATION & PRESENTATION

Current State

The crest (caregiver + elder across the Dannebrog, crown, single star) is correctly treated as an asset of record. It is never redrawn, recoloured, or distorted.

Recommendation 1: Crest Isolation Zones

Priority: Critical | **Effort:** Low | **Impact:** High

Increase the minimum clear-space around the crest by 15% on all applications. The crest is the institutional seal. It requires breathing room that signals its importance. In the current email signature and presentation applications, the crest sits too close to neighbouring text blocks. When an emblem touches its surroundings, it diminishes in perceived authority.

Specific guidance: The crest’s isolation zone should equal the height of the crown element on all four sides. This is not a logo guideline for a startup. This is a coat of arms for an institution.

Trust test: Yes. A properly isolated crest signals that the organisation respects its own mark. Municipalities notice this.

Recommendation 2: Crest Scale Hierarchy

Priority: High | Effort: Low | Impact: Medium-High

Establish three canonical scales for the crest:

- **Monumental** (40–60mm physical / 180–240px digital): Used only on certificates, formal letterheads, and the Trust Centre entrance page. Never larger. Overscaled crests feel insecure.
- **Institutional** (20–30mm / 80–120px): Standard for documents, presentations, email headers.
- **Functional** (8–12mm / 32–48px): Minimum size for footers, app icons, and UI micro-applications. Never smaller.

The current system allows the crest to appear at arbitrary sizes. A crest that is too small loses detail and dignity. A crest that is too large loses refinement.

Trust test: Yes. Scale discipline signals operational precision.

3. COLOUR SYSTEM — REFINEMENT, NOT REVISION

Current State

The palette is locked and correct: Midnight Navy #061D37 (~60%), Regal Gold #C4A05F (the voice), Dannebrog Red #941715 (10%, punctuation only), Ivory #F7F5F0 (light ground). Support: navy-deep #04152A, gold-light #E4C77D, gold-dark #8C6A2D.

Recommendation 3: The 60/30/10 Rule Enforcement

Priority: High | Effort: Medium | Impact: High

Audit every live surface (website, presentations, email signatures, documents) against the 60/30/10 distribution. The current website and presentation decks show a tendency toward 50/40/10 or even 40/40/20 distributions, where gold and navy compete rather than harmonise. This creates visual tension that reads as instability.

The correction: Navy must dominate every composition. Gold must be the voice — the accent, not the argument. Red must remain punctuation. If a page feels “warm” rather than “grounded,” the ratio is wrong.

Trust test: Yes. Colour balance is subconsciously read as financial and operational balance. A municipality assesses stability through visual stability.

Recommendation 4: Ivory Ground Purity

Priority: Medium | Effort: Low | Impact: Medium

The Ivory #F7F5F0 ground must remain unblemished. Currently, some document templates and presentation slides introduce subtle warm-grey tints (#F0EDE6, #EBE8E0) that fragment the ground plane. The eye perceives these as stains or inconsistencies.

The correction: One Ivory. One ground. Everywhere. From the website background to the Power-Point master slide to the PDF white space. Consistency of ground is the foundation of Scandinavian minimalism.

Trust test: Yes. A single, pure ground signals cleanliness and attention to detail — essential for a care organisation.

Recommendation 5: Gold Luminosity Control

Priority: Medium | Effort: Low | Impact: Medium

Regal Gold #C4A05F can appear muddy on certain screens and in print if not managed. Introduce a luminosity check: gold elements should never be placed on mid-tone backgrounds. They require either deep navy (for contrast) or ivory (for elegance). Gold on grey, gold on beige, or gold on tinted white fails.

The correction: Add a “gold placement rule” to the design system: Gold lives only on Midnight Navy, navy-deep, or Ivory. No exceptions.

Trust test: Yes. Muddy gold reads as cheap. Luminous gold reads as precious.

4. TYPOGRAPHY — HIERARCHY, BREATHING, AND SILENCE

Current State

Display: Cinzel / Cormorant Garamond. Serif body: Cormorant Garamond. The register is refined heritage, not cold. This is correct.

Recommendation 6: The Typographic Scale — Tighten the Intervals

Priority: Critical | Effort: Low | Impact: Very High

The current type scale has too many steps and insufficient differentiation between adjacent sizes. This creates a “mushy” hierarchy where the eye cannot instantly distinguish between a heading and a subheading, or between a subheading and body text.

The correction: Reduce the scale to six canonical sizes with a 1.25 ratio (major third), not the current 1.15 ratio. The larger interval forces decisive hierarchy:

Token	Size	Weight	Line Height	Usage
Display	48–64px	400	1.1	Hero statements only
H1	38px	400	1.2	Page titles
H2	30px	400	1.25	Section headers
H3	24px	500	1.3	Sub-sections
Body Large	19px	400	1.6	Lead paragraphs, care descriptions
Body	16px	400	1.7	Standard text
Caption	13px	500	1.5	Labels, metadata, footnotes

Critical note: The current website uses 18px and 20px as distinct tokens. They are too close. Collapse them. Decisive hierarchy is more trustworthy than granular hierarchy.

Trust test: Yes. Clear hierarchy reads as clear thinking. Municipalities and families need to know immediately what matters most on a page.

Recommendation 7: Line Length Discipline

Priority: High | Effort: Low | Impact: High

The current website and documents allow text lines to extend to 90–100 characters. Optimal reading length for Cormorant Garamond is 55–75 characters. Beyond this, the eye loses its place, and comprehension drops.

The correction: Constrain all body text to a maximum of 70 characters per line. On the website, this means `max-width: 38em` for paragraphs. In documents, this means narrower text blocks or two-column layouts for long-form content. In presentations, never more than 55 characters per line.

Trust test: Yes. Readable text signals respect for the reader’s time and cognitive capacity. This is especially important for families under stress.

Recommendation 8: Paragraph Spacing — The 1.5× Rule

Priority: Medium | Effort: Low | Impact: Medium-High

Current paragraph spacing appears to use 1em or 1.25em between paragraphs. This is too tight. Cormorant Garamond’s generous x-height and open counters need more air between thoughts.

The correction: Set paragraph spacing to 1.5× the line height. If line height is 1.7 (28.8px for 16px type), paragraph spacing should be 43px. This creates “thought blocks” that the mind can process discretely. Tight paragraphs feel rushed. Generous paragraphs feel considered.

Trust test: Yes. Space between paragraphs signals that each statement has been weighed before being offered.

Recommendation 9: Display Type — Cinzel Only for Institutional Statements

Priority: High | Effort: Low | Impact: High

Cinzel is currently used in places where Cormorant Garamond would be more appropriate — body text, long descriptions, and some UI labels. Cinzel is a display face. Its letterforms are architectural. Using it for sentences longer than six words creates fatigue.

The correction: Reserve Cinzel exclusively for: the brand name, page hero statements (maximum 8 words), certificate titles, and formal document headers. Everything else — every sentence, every paragraph, every description — uses Cormorant Garamond.

Trust test: Yes. Correct typeface discipline signals professional training and respect for craft.

Recommendation 10: The Single Serif Principle

Priority: Medium | Effort: Low | Impact: Medium

The current system uses both Cinzel and Cormorant Garamond as “display” options. This creates ambiguity. When a designer or developer opens the design system, they face a choice that should not exist.

The correction: Establish a single serif display face: Cormorant Garamond for all editorial and communicative display. Cinzel becomes a *brand mark element* — used only for the word “Premium Care” in the logo lockup and in hero statements that echo the brand name. It is not a general-purpose display font.

Trust test: Yes. One voice. One typeface. One institution.

5. SPACING & COMPOSITION — THE SCANDINAVIAN IMPERATIVE

Current State

The design system has spacing tokens, but their application is inconsistent across modules. Some pages feel airy. Others feel crowded. The website, in particular, shows variable density.

Recommendation 11: The 8-Base Grid with 16-Base Sections

Priority: Critical | Effort: Medium | Impact: Very High

Move from a 4px base grid to an 8px base grid for all micro-spacing (padding, margins, component gaps). Use a 16px base for macro-spacing (section breaks, page margins).

Why: The current 4px grid creates too many possible spacing values. Designers and developers make arbitrary choices. An 8px grid with 16px sections reduces the decision space to: 8, 16, 24, 32, 48, 64, 96, 128px. This creates rhythmic consistency that the eye perceives as calm and ordered.

Specific application:

- Component internal padding: 24px or 32px
- Component gap: 16px or 24px
- Section break: 96px or 128px
- Page margin (desktop): 64px minimum
- Page margin (mobile): 24px minimum

Trust test: Yes. Mathematical spacing is the visible evidence of systematic thinking. Municipalities trust systems, not improvisation.

Recommendation 12: Asymmetrical Balance — The Golden Ratio Margin

Priority: Medium | Effort: Low | Impact: Medium-High

Current layouts tend toward symmetrical centre alignment. Scandinavian luxury favours asymmetrical balance — more space on the left than the right, or more space above than below.

The correction: For all major layouts, apply a 1.618:1 ratio to margins. If the top margin is 96px, the bottom margin is 60px. If the left margin is 64px, the right margin is 40px. This creates dynamic tension that feels alive rather than static.

Note: This applies to compositions, not to text blocks. Text blocks remain centred or left-aligned with consistent margins. The asymmetry is in the *container*, not the *content*.

Trust test: Yes. Asymmetrical balance signals confidence and sophistication. Symmetrical balance signals caution and inexperience.

Recommendation 13: The Rule of Thirds for Photography

Priority: Medium | Effort: Low | Impact: Medium

Current photography is brand-graded and high quality. However, the cropping and placement often centre the subject. In luxury editorial, the subject sits at the intersection of thirds, with generous negative space in the direction the subject is looking or moving.

The correction: For all hero photography and feature images, place the focal point at the upper-left or lower-right third intersection. Never dead centre. The caregiver's gaze or the elder's gesture should direct the viewer's eye into the negative space, which is then occupied by text.

Trust test: Yes. Editorial photography signals editorial standards. Centre-weighted photography signals stock imagery.

Recommendation 14: Vertical Rhythm — The 24px Baseline

Priority: High | Effort: Medium | Impact: High

Establish a 24px baseline grid for all text-heavy surfaces. Every line of text, every heading, every caption, every rule line should align to this baseline. This means line heights must be multiples of 24px (24, 48, 72, 96).

The correction: Adjust body text line height to 1.5 (24px for 16px type). Adjust heading line heights to snap to the nearest 24px multiple. This creates a “ruled paper” effect that is invisible but palpable. The page feels organised even when the reader cannot say why.

Trust test: Yes. Baseline alignment is the hallmark of professional publishing. It signals that the organisation holds itself to print-standard discipline even in digital.

6. STORYTELLING & EMOTIONAL IMPACT

Current State

The brand promise — *Omsorg · Tryghed · Hver Dag* — is correct and powerful. However, the narrative architecture across surfaces does not yet fully translate this promise into emotional experience.

Recommendation 15: The Three-Beat Narrative

Priority: Critical | Effort: Medium | Impact: Very High

Every page, every presentation, every document should follow a three-beat narrative structure:

1. **The Recognition** (“We understand”) — Acknowledge the audience's situation in their own language.
2. **The Distinction** (“We are different”) — State what Premium Care does that no one else does, without criticising competitors.
3. **The Invitation** (“We are here”) — Offer a clear, dignified next step.

Current gap: The website and presentations often jump from introduction to service description without the emotional bridge. The family landing page, for example, lists services before establishing empathy.

The correction: Reorder every primary surface to begin with the emotional reality (“Your mother has lived in her home for forty years. The idea of change is not simply inconvenient — it is a kind of grief.”) before introducing any service, feature, or credential.

Trust test: Yes. Emotional recognition is the prerequisite for trust. A family will not read about services until they believe the writer understands their fear.

Recommendation 16: The Voice of the Elder

Priority: High | Effort: Medium | Impact: Very High

The current brand voice speaks *about* elders and *to* families. It rarely speaks *as* an elder or *with* an elder. The most powerful trust signal in elderly care is the elder’s own voice.

The correction: Introduce “The Voice of the Elder” as a content module. Short, unedited quotations from Premium Care clients — not testimonials, but *statements of presence*. Example: “I did not want someone to take care of me. I wanted someone to sit with me. That is what they do.”

Rules for this module:

- No quotation marks in the display treatment. The text is set as a block, like a poem.
- No attribution line (“— Mrs. Hansen, 84”). The voice is universal.
- Set in Cormorant Garamond Italic, 19px, on Ivory, with 96px margin above and below.
- Never more than 25 words.
- Never promotional. Never edited for marketing impact.

Trust test: Yes. The unmediated voice of the cared-for is the most powerful trust instrument available. It cannot be faked.

Recommendation 17: The Caregiver’s Gaze

Priority: High | Effort: Low | Impact: High

Current photography shows caregivers *doing* — administering care, assisting, working. The most emotionally resonant care photography shows caregivers *being present* — sitting, listening, holding a hand without performing a task.

The correction: For every three photographs of care in action, include one photograph of care in stillness. The caregiver and elder sitting side by side, looking out a window. No eye contact with the camera. No smile required. The light is natural. The moment is unhurried.

Technical specification: These images should be shot at 50mm equivalent or longer. No wide-angle distortion. No flash. The colour grade should be slightly warmer than the standard brand grade — 2% more yellow in the shadows — to signal intimacy.

Trust test: Yes. Stillness is the visual equivalent of “we have time.” In a sector where time is the scarcest resource, the image of unhurried presence is revolutionary.

7. TRUST & CREDIBILITY ARCHITECTURE

Current State

The Trust Centre and governance documents are comprehensive. However, trust is not only built through documentation. It is built through *signalling* — small, consistent cues that accumulate into confidence.

Recommendation 18: The Trust Bar — A Persistent Micro-Surface

Priority: High | Effort: Medium | Impact: High

Every page, every document, every email should include a “Trust Bar” — a single horizontal line of metadata that signals institutional substance without demanding attention.

Specification:

- Position: Footer of every surface, or bottom margin of every page.
- Content: CVR: [number] • Godkendt af [municipality] • Dansk Arbejdsmiljø • ISO 9001:2015
- Typography: Caption size (13px), uppercase, letter-spacing 0.05em, Regal Gold on Midnight Navy or navy-deep.
- Height: 32px minimum.
- Never more than one line. Never promotional language. Only facts.

Why this works: Municipalities and families scan for credentials. If they must search for them, doubt enters. If credentials are always present, confidence accumulates.

Trust test: Yes. Persistent credentials signal transparency. Hidden credentials signal evasion.

Recommendation 19: The Date Stamp — Living Documents

Priority: Medium | Effort: Low | Impact: Medium

Every document, every page, every presentation should display a “Last verified” date, not a “Last updated” date. “Updated” implies change. “Verified” implies stability.

Specification:

- Position: Adjacent to the Trust Bar or in the footer.
- Format: Verificeret juli 2026 (Danish) / Verified July 2026 (English)
- Typography: Caption size, regular weight, 50% opacity.

Trust test: Yes. “Verified” signals ongoing vigilance. “Updated” signals reactive maintenance.

Recommendation 20: The Signature Block — Humanising Formal Communication

Priority: Medium | Effort: Low | Impact: Medium-High

Formal documents and emails currently use standard signature blocks. In an institution of care, the signature block should signal humanity within formality.

The correction: Every formal communication should include a handwritten signature scan (not a font) of the sender, in Regal Gold, above the typed name. The scan should be high resolution (300dpi minimum), with natural pen stroke variation visible.

Rules:

- Only for formal documents, proposals, and family welcome packs.
- Not for routine email or internal communication.
- The signature should be 18mm wide, never larger.
- No title below the typed name. The signature speaks for itself.

Trust test: Yes. A human signature on a formal document is a promise. A typed name is only information.

8. LUXURY RESTRAINT — WHAT TO REMOVE

Recommendation 21: Eliminate All Decorative Rules and Dividers

Priority: Critical | **Effort:** Low | **Impact:** Very High

The current design system includes horizontal rules, section dividers, and decorative lines. Remove 80% of them. Keep only:

- The Trust Bar (Recommendation 18)
- One 1px rule between the header and body on formal documents
- One 1px rule above the footer on web pages

Why: Every line that does not carry information is visual noise. In luxury, the absence of decoration is the decoration. The current system has too many lines creating too many boxes. Boxes feel institutional in the wrong way — bureaucratic, not premium.

The correction: Use whitespace as the primary separator. If two sections need distinction, separate them with 96px of space, not with a line.

Trust test: Yes. Restraint signals confidence. Decoration signals insecurity.

Recommendation 22: Reduce Button Styles to Two

Priority: High | **Effort:** Low | **Impact:** High

The current system has multiple button styles — filled, outlined, ghost, with icons, without icons. Reduce to two:

1. **Primary:** Midnight Navy fill, Ivory text, no border-radius (square corners), 48px height, 16px horizontal padding. Used for the single most important action on a page.
2. **Secondary:** Transparent fill, Midnight Navy text, 1px Midnight Navy border, same dimensions. Used for all other actions.

Remove: All other button variants. All icon-only buttons. All “tertiary” buttons. All rounded buttons. All gradient buttons. All shadowed buttons.

Why: Buttons are invitations to act. Too many styles create decision fatigue. Two styles create clarity. Square corners signal institutional seriousness. Rounded corners signal consumer software.

Trust test: Yes. A municipality procurement officer sees a square-cornered navy button and thinks “serious organisation.” A rounded gradient button reads as “app.”

Recommendation 23: Remove All Drop Shadows

Priority: High | Effort: Low | Impact: High

Drop shadows currently appear on cards, buttons, and some navigation elements. Remove all of them. Everywhere.

The correction: Use 1px solid borders (Midnight Navy at 10% opacity) to create elevation if absolutely necessary. Prefer flat planes with generous spacing. Shadows create depth, but depth in digital design is a metaphor from 2012. In 2026, flatness signals confidence and modernity.

Exception: None. Even on the mobile app. Even on modals. Even on dropdowns.

Trust test: Yes. Flat surfaces signal honesty. Shadows signal manipulation and artifice.

Recommendation 24: Eliminate All Icons Except the Icon Library

Priority: Medium | Effort: Medium | Impact: Medium-High

The current system uses a mix of the Sunnah Remedies icon library (from conversation history, adapted for Premium Care) and generic icon sets (Feather, Heroicons, etc.). This creates visual inconsistency. A family sees one style of heart icon on the website and another in the portal.

The correction: Audit every icon across all surfaces. Replace all non-library icons with the Premium Care icon library. If the library does not contain a needed icon, commission it. Never substitute a generic icon.

Rules:

- Icons are always 24px or 16px. No other sizes.
- Icons are always stroke-based, 1.5px stroke weight, rounded caps.
- Icons are always Midnight Navy or Regal Gold. No other colours.
- Icons never appear without a text label, except in the mobile app tab bar.

Trust test: Yes. Icon consistency is a micro-signal of institutional coherence.

9. SCANDINAVIAN MINIMALISM — THE DANISH WELFARE TRADITION

Recommendation 25: The Single-Column Reading Experience

Priority: High | Effort: Medium | Impact: High

The current website and documents use multi-column layouts in places where a single column would be more powerful. Scandinavian design favours the long, unbroken column. It signals clarity, honesty, and sequential thinking.

The correction:

- All web pages: single column for all text content. Maximum width 680px.
- All documents: single column unless the content is explicitly comparative (e.g., a side-by-side service comparison).
- All presentations: one idea per slide. Never bullet points. Never more than 40 words per slide.

Why: Multi-column layouts force the eye to jump. Jumping creates fatigue. A single column is a straight path. The reader feels guided, not challenged.

Trust test: Yes. A single column is the architectural equivalent of a well-lit corridor. It says, “We will not make this difficult for you.”

Recommendation 26: The Empty Third

Priority: Medium | Effort: Low | Impact: Medium-High

In every composition, one-third of the space should be empty. Not “white space” as a design concept, but *deliberate emptiness* — a void that allows the content to resonate.

The correction:

- On the website, the right third of every above-the-fold section should be empty or occupied only by a single, carefully placed image.
- In documents, the right margin should be 40% of the text block width, not 20%.
- In presentations, the right 30% of every slide should be empty, reserved for the eye to rest.

Why: The Danish welfare tradition is not about filling every space with service. It is about providing what is needed and no more. The visual system must mirror this philosophy.

Trust test: Yes. Emptiness signals abundance. A crowded page signals scarcity and desperation.

Recommendation 27: The Material Truth — No Gradients, No Patterns

Priority: Medium | Effort: Low | Impact: Medium

Remove all gradients, all background patterns, all texture overlays. The current system is largely clean, but some presentation slides and document covers introduce subtle gradients that read as decoration.

The correction: Every surface is a single flat colour. Midnight Navy. Ivory. Regal Gold. Dannebrog Red. No blends. No fades. No textures. Material truth is a Scandinavian principle: the surface is what it is. It does not pretend to be something else.

Trust test: Yes. Flat colour is honest. Gradient is cosmetic.

10. THE FAMILY EXPERIENCE — EMOTIONAL JOURNEY MAPPING

Recommendation 28: The First 30 Seconds — The Silence Before Service

Priority: Critical | Effort: Medium | Impact: Very High

The current website homepage opens with a statement of service. This is premature. A family visiting the site is not yet ready to hear about services. They are in a state of concern, guilt, or grief.

The correction: The homepage hero should contain no service description for the first 30 seconds of the user’s attention. Instead, it should contain:

- A single photograph of stillness (Recommendation 17)
- A headline of no more than six words: “Din mor fortjener tryghed.” (Your mother deserves security.)

- A single line of body text: “At beslutte sig for hjemmehjælp er ikke nemt. Vi er her, når du er klar.” (Deciding on home care is not easy. We are here when you are ready.)
- One button: “Læs om vores tilgang” (Read about our approach) — secondary style.
- No navigation visible above the fold except the wordmark and a single “Kontakt” link.

Why: The first 30 seconds must be an emotional landing, not a commercial pitch. The family must feel understood before they will read about services.

Trust test: Yes. A homepage that does not sell is a homepage that builds trust. The sale happens on page two, after the trust is established.

Recommendation 29: The Approach Page — Philosophy Before Logistics

Priority: High | Effort: Medium | Impact: High

The current site structure likely moves from homepage to services. Insert a mandatory page: “Vores tilgang” (Our Approach).

Content architecture:

1. **The Promise** (one paragraph): What Premium Care believes about elderly care.
2. **The People** (three photographs): Three caregivers, not posed, in their uniforms, looking at the camera with neutral expressions. Names and titles below. No bios. The image is the bio.
3. **The Process** (a simple timeline): Five steps from first contact to first visit. No detail. Just the shape of the journey.
4. **The Guarantee** (one sentence): “Hvis du ikke føler dig tryk efter den første uge, finder vi sammen en anden løsning.” (If you do not feel secure after the first week, we will find another solution together.)

Why: Families do not buy services. They buy confidence in a process. The Approach page sells the process, not the service.

Trust test: Yes. Process transparency is the antidote to anxiety.

Recommendation 30: The Price Page — Dignity in Disclosure

Priority: High | Effort: Low | Impact: High

Price is currently either absent or buried. In Danish elderly care, price is not a commercial secret. It is a point of municipal negotiation and family planning. Hiding it signals opacity.

The correction: Create a dedicated “Priser og finansiering” page. Do not list prices as a table. Instead, use a narrative structure:

- **The Municipality Path:** “Hvis din kommune dækker omkostningerne...” (If your municipality covers the costs...)
- **The Private Path:** “Hvis du vælger privat betaling...” (If you choose private payment...)
- **The Hybrid Path:** “Hvis du har brug for mere end kommunen tilbyder...” (If you need more than the municipality offers...)

Each path has a starting price, clearly stated, with the note: “Præcis pris afhænger af dit behov. Kontakt os for en vurdering.” (Exact price depends on your needs. Contact us for an assessment.)

Design: The price numbers should be set in Cinzel, 38px, Regal Gold, on Ivory. The surrounding text in Cormorant Garamond, 16px. The number is the focal point. The explanation is the context.

Trust test: Yes. Visible price signals honesty. Hidden price signals exploitation.

11. THE MUNICIPALITY EXPERIENCE — AUTHORITY AND EFFICIENCY

Recommendation 31: The Decision Pack — A Single PDF

Priority: Critical | Effort: High | Impact: Very High

Municipalities currently receive multiple documents. Consolidate into a single, definitive PDF: “Premium Care — Kommunalt Beslutningsgrundlag” (Municipal Decision Basis).

Specification:

- 24 pages maximum. A4, portrait.
- Cover: Crest at monumental scale (Recommendation 2), title in Cinzel, no other text.
- Page 2: Table of contents.
- Pages 3–6: The Institution (history, mission, values, governance).
- Pages 7–12: The Standards (care protocols, quality metrics, training, compliance).
- Pages 13–18: The Evidence (case studies, outcomes, testimonials from other municipalities).
- Pages 19–22: The Economics (pricing model, value proposition, ROI for municipality).
- Page 23: The Guarantee (quality assurance, escalation path, contact).
- Page 24: Back cover with crest, address, CVR, Trust Bar.

Design rules:

- One photograph per double-page spread. Never more.
- No bullet points. Short paragraphs only.
- Every page number in the outer margin, Regal Gold, 13px.
- Running header on every page: “Premium Care · Kommunalt Beslutningsgrundlag” in 10px, upper-case, letter-spaced.

Trust test: Yes. A single, beautiful document signals respect for the municipality’s time. Multiple documents signal disorganisation.

Recommendation 32: The Quality Dashboard — A Live Surface

Priority: Medium | Effort: High | Impact: High

Create a password-protected “Quality Dashboard” for municipality partners. Not a marketing page. A live data surface.

Content:

- Current client satisfaction score (updated monthly)

- Caregiver retention rate (updated quarterly)
- Incident report summary (updated monthly, anonymised)
- Training completion rate (updated quarterly)
- Comparison to municipal averages (where data is available)

Design:

- Minimalist charts. No 3D. No gradients. Navy lines on Ivory. Gold for the Premium Care data line. Grey for municipal average.
- No promotional text. Only data, labels, and source notes.
- Updated date prominently displayed.

Trust test: Yes. Live data is the ultimate trust instrument. It cannot be faked or frozen in time.

12. THE EMPLOYEE EXPERIENCE — DIGNITY IN RECRUITMENT

Recommendation 33: The Careers Page — A Letter, Not a Listing

Priority: High | Effort: Medium | Impact: High

The current careers page likely lists job openings. This is functional but not emotional. Caregivers do not apply to companies. They apply to callings.

The correction: The careers page should open with a letter from the Head of Care — not a CEO, not a director, but the person who trains caregivers. The letter should be 150 words maximum, in Cormorant Garamond, 19px, set as a single column with generous margins.

Example opening: “Vi leder ikke efter ansatte. Vi leder efter mennesker, der ikke kan lade være med at passe på andre. Hvis du genkender det i dig selv, er du allerede en af os.”

(We are not looking for employees. We are looking for people who cannot stop caring for others. If you recognise that in yourself, you are already one of us.)

Below the letter: A single button: “Se vores ledige stillinger” (See our open positions). The job listings are secondary. The letter is primary.

Trust test: Yes. A letter from a peer signals community. A job listing from HR signals bureaucracy.

Recommendation 34: The Uniform as a Trust Signal

Priority: Medium | Effort: Low | Impact: Medium

The uniform system (from conversation history) is excellent. However, it is not yet visible enough in the brand experience. The uniform should appear in:

- The careers page hero photograph
- The Trust Centre header image
- The footer of every document (a small photograph of a caregiver’s uniform sleeve, showing the crest embroidered)

Why: The uniform is the brand made physical. It signals that Premium Care is not a digital abstraction but a physical presence in Danish homes. The crest on the sleeve is a promise worn on the body.

Trust test: Yes. A uniform is a covenant. Seeing it builds confidence in the physical reality of the service.

13. TYPOGRAPHY MICRO-REFINEMENTS

Recommendation 35: The Hanging Quote

Priority: Medium | Effort: Low | Impact: Medium

When block quotations are used (especially “The Voice of the Elder,” Recommendation 16), apply a “hanging” quotation mark. The opening quotation mark is set in the left margin, 48px, Regal Gold, Cinzel. The text begins flush with the body text, not indented.

Why: The hanging quote is a Scandinavian editorial tradition. It signals that the quotation is not merely text but an event. The large gold mark in the margin is a visual drumroll.

Trust test: Yes. Editorial detail signals editorial standards.

Recommendation 36: The No-All-Caps Rule

Priority: High | Effort: Low | Impact: High

Eliminate all all-caps text except:

- The Trust Bar (Recommendation 18)
- Running headers in formal documents
- The “Premium Care” wordmark in the logo lockup

All-caps body text, button labels, navigation, and headings should be converted to sentence case or title case. All-caps in digital interfaces reads as shouting. In Scandinavian design, shouting is never appropriate.

The correction: Button labels become “Kontakt os” not “KONTAKT OS”. Navigation becomes “Om os” not “OM OS”. Form labels become “Dit navn” not “DIT NAVN”.

Trust test: Yes. Sentence case is a conversation. All-caps is a command. Care is a conversation.

Recommendation 37: The Ellipsis as a Pause

Priority: Low | Effort: Low | Impact: Medium

In headlines and subheadings, replace all instances of “...” (three periods) with the proper ellipsis character “...” (Unicode 2026). The difference is nearly invisible but palpable to the trained eye. The ellipsis is a single glyph with consistent spacing. Three periods are three separate glyphs with variable spacing.

Where to use: Headlines that trail off, invitations to continue reading, and the brand promise itself: “Omsorg ·Tryghed ·Hver Dag...” (with the ellipsis suggesting continuation, not conclusion).

Trust test: Yes. Typographic precision is the mark of an organisation that cares about details.

14. PHOTOGRAPHY & IMAGERY

Recommendation 38: The Colour Grade — Warmth Without Sentimentality

Priority: High | Effort: Medium | Impact: High

Current photography is brand-graded. The grade should be refined to introduce 3–5% more warmth in the shadow tones without shifting the overall palette. The current grade is slightly cool, which reads as clinical. Scandinavian warmth is not sentimentality — it is the difference between a hospital corridor and a Danish living room at 4pm in winter.

Technical specification:

- Shadows: +4% yellow, -2% blue
- Midtones: neutral
- Highlights: -3% red, +2% green
- Overall saturation: -8% (desaturation increases perceived sophistication)
- Contrast: reduce by 5% (softer contrast is more inviting)

Trust test: Yes. Warmth signals welcome. Coolness signals procedure.

Recommendation 39: The No-Stock Rule

Priority: Critical | Effort: High | Impact: Very High

Audit every image across all surfaces. Any image that is recognisably stock photography must be replaced with commissioned photography. The current system has ~85 brand-graded photographs. This is a strong foundation, but stock images may have crept into secondary pages, blog posts, or document templates.

The test: If an image shows a generic “happy elderly person” with perfect lighting and no environmental specificity, it is stock. If it shows a real Danish home, a real Premium Care caregiver, a real client (with consent), it is authentic.

The correction: Commission a second round of photography: 40 images, all in real Danish homes, all with real caregivers and real clients (with full consent and dignity protocols). No smiling for the camera. No looking at the camera unless it is a portrait. The camera is a guest, not a director.

Trust test: Yes. Authenticity is the only currency that cannot be counterfeited.

Recommendation 40: The Portrait Protocol

Priority: Medium | Effort: Low | Impact: Medium

For all caregiver portraits, establish a single protocol:

- 85mm equivalent lens (no facial distortion)
- Natural window light, no flash
- Neutral background (Ivory wall, or a softly blurred Danish interior)
- The caregiver looks directly at the camera with a neutral expression — not smiling, not serious, simply present.
- The photograph is cropped at the chest, not the head.
- No uniforms in the portrait. The person, not the role.

Why: The chest-up crop with neutral expression is the visual language of institutional portraiture — universities, hospitals, and serious organisations. The smile is for marketing. The neutral expression is for trust.

Trust test: Yes. A neutral portrait signals professionalism. A smiling portrait signals sales.

15. THE MOBILE EXPERIENCE — INTIMACY AT SMALL SCALE

Recommendation 41: The Thumb Zone — Navigation at the Bottom

Priority: High | Effort: Medium | Impact: High

The current mobile website likely has a hamburger menu at the top right. Move the primary navigation to the bottom of the screen on mobile, in a persistent tab bar. The thumb zone is the bottom 25% of the screen. Reaching to the top right requires a hand position change that creates physical friction.

Specification:

- Tab bar: 64px height, Midnight Navy, Ivory icons and labels.
- Four tabs maximum: “Tilgang”, “Services”, “Om os”, “Kontakt”.
- Icons only, no text labels, except the active tab which shows a text label.
- No “Home” tab. The logo in the top left (tappable) serves as home.

Trust test: Yes. Physical ease signals consideration. A family member checking the site while sitting with their parent should not struggle to navigate.

Recommendation 42: The Single-Thumb Reading Line

Priority: Medium | Effort: Low | Impact: Medium

On mobile, all body text should be set to a comfortable single-thumb reading width. This means 16px type with 1.7 line height, and a maximum line length of 45 characters. The current mobile experience likely allows lines to extend to 60+ characters on wider phones.

The correction: max-width: 22em for all mobile paragraphs. This creates a narrow, comfortable column that can be read with one thumb scrolling.

Trust test: Yes. Reading comfort is a form of care.

16. THE EMAIL EXPERIENCE — THE MOST FREQUENT TOUCH-POINT

Recommendation 43: The Email Signature — Institutional Minimalism

Priority: Critical | Effort: Low | Impact: Very High

The current email signature system (from conversation history) is sophisticated. It should be refined further:

- Remove all social media icons. A care institution does not need social media in its formal signature. Social media is for consumer brands.

- Remove the physical address unless the email is from the administration. Caregivers and nurses do not need to display the office address.
- Reduce the crest to functional scale (Recommendation 2): 32px width, never larger in email.
- The name should be in Cormorant Garamond, 16px, Midnight Navy.
- The title should be in 13px, Regal Gold, uppercase, letter-spaced 0.05em.
- A single 1px rule, 100px wide, Regal Gold, separates the signature from the body.
- Below the rule: name, title, phone, email. No more. No fax. No mobile and landline. One phone number.

Trust test: Yes. An email signature is a handshake. It should be firm, brief, and memorable.

Recommendation 44: The Subject Line — Poetry, Not Promotion

Priority: Medium | Effort: Low | Impact: Medium

Email subject lines currently likely follow standard business patterns: “Premium Care — Meeting Confirmation” or “Re: Your Inquiry.” These are functional but not warm.

The correction: Subject lines should be short, specific, and human:

- “Din aftale den 15. juli” (Your appointment on 15 July) — not “Meeting Confirmation”
- “Svar på din henvendelse” (Response to your inquiry) — not “Re: Your Inquiry”
- “Velkommen til Premium Care” (Welcome to Premium Care) — not “Welcome / Onboarding Pack”

Rule: Never more than six words. Never promotional. Never urgent unless actually urgent.

Trust test: Yes. A human subject line signals a human sender. A templated subject line signals a system.

17. THE PRESENTATION EXPERIENCE — THE MUNICIPALITY PITCH

Recommendation 45: The One-Idea Slide

Priority: Critical | Effort: Medium | Impact: Very High

Current presentations (from conversation history) contain dense information. For municipality pitches, adopt a strict rule: one idea per slide. Maximum 12 words per slide. One image or one data point. No bullet points. No exceptions.

Structure for a 20-slide municipality pitch:

1. Title slide: Crest, title, date. No other text.
2. The silence: A photograph of stillness. No text.
3. The recognition: “At vælge hjemmehjælp er ikke nemt.” (Choosing home care is not easy.) Six words.
4. The distinction: “Premium Care er en institution, ikke en virksomhed.” (Premium Care is an institution, not a company.) Seven words.

5. The evidence: One number. “94% tilfredshed.” (94% satisfaction.) 6–18. The story: One idea per slide, alternating between image and text.
6. The invitation: “Lad os mødes.” (Let us meet.) Three words.
7. The close: Crest, contact, Trust Bar.

Why: Municipalities sit through dozens of pitches. A pitch that respects their time by saying less is remembered more.

Trust test: Yes. Brevity is the soul of authority.

Recommendation 46: The Data Slide — One Number, One Context

Priority: High | Effort: Low | Impact: High

When presenting data (satisfaction rates, retention, etc.), use only one number per slide. The number should be 64px, Cinzel, Regal Gold, centred. Below it, one line of context: 16px, Cormorant Garamond, Midnight Navy.

Example:

94%
Årlig klienttilfredshed, målt af uafhængig part (Annual client satisfaction, measured by independent party)

No charts. No comparisons. No trend lines. One number. One context. The number is the evidence. The context is the credibility.

Trust test: Yes. A single number is a fact. A chart is an argument.

18. THE DOCUMENT EXPERIENCE — EVERY PDF IS A PROMISE

Recommendation 47: The PDF as a Physical Object

Priority: High | Effort: Medium | Impact: High

Every PDF produced by Premium Care should be designed as if it will be printed, even if it is only viewed digitally. This means:

- Page margins: 25mm all sides, with the outer margin (binding side) at 30mm.
- Page numbers: outer margin, bottom, 13px, Regal Gold.
- Running header: inner margin, top, 10px, uppercase, letter-spaced.
- No hyperlinks in body text. Links appear as footnotes at the bottom of the page, with the URL in 10px monospace.
- All text selectable and searchable. No text as image.

Why: A PDF that is designed for print signals permanence. A PDF that is designed only for screen signals transience. Municipalities file printed documents. Families save printed documents. Permanence is trust.

Trust test: Yes. A document designed for print is a document designed to last.

Recommendation 48: The Cover Page — Crest, Title, Silence

Priority: Medium | Effort: Low | Impact: Medium

Every document cover should contain only:

- The crest, monumental scale (Recommendation 2), upper third, centred.
- The document title, H1 scale, centred, below the crest.
- The date, caption scale, centred, below the title.
- Nothing else. No abstract. No author name. No page count. No decorative elements.

Why: The cover is the threshold. It should be a moment of pause before entering. Information on the cover is clutter. The crest and title are sufficient.

Trust test: Yes. A quiet cover signals that the content within has been given room to breathe.

19. THE TRUST CENTRE — GOVERNANCE AS DESIGN

Recommendation 49: The Trust Centre as a Library, Not a Dashboard

Priority: High | Effort: Medium | Impact: High

The current Trust Centre concept (from `08_TRUST_CENTRE.md`) is governance-as-advantage. The visual execution should mirror a physical library — wood tones (metaphorically, through colour), ordered shelves (through grid), and the quiet authority of bound volumes.

The correction:

- Background: Ivory, not white.
- Navigation: A vertical left sidebar, 240px wide, Midnight Navy, with links in 14px Cormorant Garamond, Ivory. The active link is Regal Gold.
- Content area: Single column, 680px maximum, generous margins.
- Documents: Displayed as “spines” — horizontal rectangles, 48px tall, with the document title, date, and a download icon. No preview. No thumbnail. The spine is sufficient.
- Search: A single search bar at the top, 48px tall, no border, 1px bottom rule in Regal Gold, placeholder text: “Søg i dokumenter...”

Why: A library is a place of trust. A dashboard is a place of control. Premium Care offers trust, not control.

Trust test: Yes. A library signals permanence and openness. A dashboard signals surveillance and management.

20. FINAL PRINCIPLE — THE PREMIUM CARE STANDARD

Recommendation 50: The One-Question Filter

Priority: Critical | Effort: None (ongoing discipline) | Impact: Infinite

Before any design decision, content decision, or operational change is approved, it must pass the One-Question Filter:

“Would this make Premium Care feel like Denmark’s most trusted elderly care organisation?”

If the answer is not an immediate, unqualified yes, the decision is no.

This is not a marketing test. It is an institutional test.

- A new button colour? Would it increase trust? No? Then the current colour stays.
- A new social media campaign? Would it increase trust? No? Then it does not happen.
- A new service offering? Would it increase trust? No? Then it is not offered.
- A new hire? Would they increase trust? No? Then they are not hired.

Why: Trust is not a design attribute. It is the *only* design attribute. Everything else — beauty, functionality, efficiency — is subordinate to trust. An efficient system that is not trusted is worthless. A beautiful website that is not trusted is decoration. A functional service that is not trusted is a transaction.

Trust test: Yes. This is the standard by which all other standards are measured.

APPENDIX A: IMPLEMENTATION PRIORITY MATRIX

Priority	Recommendations	Effort	Impact	Owner
Critical (Launch Blocker)	1, 6, 11, 15, 21, 22, 28, 31, 39, 45, 50	Low-High	Very High	Creative Director / Design Lead
High (Launch Essential)	2, 3, 7, 9, 12, 14, 16, 17, 18, 25, 29, 30, 33, 38, 41, 43, 46, 47, 49	Low-Medium	High	Design Lead / Content Lead
Medium (Post-Launch Refinement)	4, 5, 8, 10, 13, 19, 20, 23, 24, 26, 27, 32, 34, 35, 36, 37, 40, 42, 44, 48	Low-Medium	Medium	Design Team / Content Team

APPENDIX B: THE NON-NEGOTIABLES CHECKLIST

Before launch, every surface must pass this checklist:

- No drop shadows anywhere
- No more than two button styles
- No all-caps text except Trust Bar and running headers
- No decorative rules or dividers except the Trust Bar and one header rule
- No stock photography
- No gradients or patterns
- No more than six words in any hero headline
- No more than 40 words per presentation slide
- No more than 70 characters per line of body text
- The crest isolation zone equals the crown height on all sides
- The Trust Bar appears on every surface

- The 60/30/10 colour ratio is maintained on every page
- Every page begins with emotional recognition before service description
- The One-Question Filter has been applied to every decision

Omsorg · Tryghed · Hver Dag

End of document.
